

#### **Features**

- Maximum Voltage Input 28V
- Wide Operation Voltage Range from 4V to 24V
- Low Current Consumption
  - Normal Mode 4µA at +25°C
  - Shutdown Mode 0.4µA at +25°C
- High Accuracy Voltage Detection Circuit for each cell
  - Programmable Overcharge Threshold Voltage from 4.1V to 4.8V in 50mV step
  - Overcharge Threshold Accuracy ±20mV (+25°C)
  - Overcharge Threshold Accuracy ±25mV (-10°C to +60°C)
  - Overcharge Hysteresis Voltage –380mV
- Internal Delay Timer for Overcharge
  - Selectable Overcharge Detection Delay Time 2s, 4s, 6s, and 8s
  - Selectable Delay Time for Shutdown 2s, 4s, 6s, and 8s
- High CO Pull Up Voltage
  - Selectable CMOS Active High or Low output
- Test Mode to Shorten Mass Production Time
- Integrated Linear Regulator
  - Selectable LDO Output 3.0V, and 3.3V
  - LDO output Cut off Voltage 2.5V
  - Output Current 2mA
  - Short Circuit Protector

### **Applications**

- Notebook
- · Portable Equipment

### **Description**

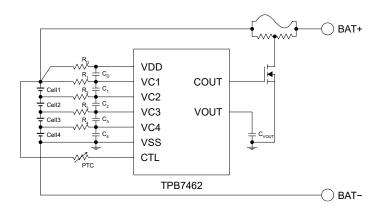

The TPB7462 series is a secondary overcharge hardware protector for 2s, 3s, or 4s lithium-ion battery packs

TPB7462 series provides high accuracy overcharge threshold to avoid the safety risk from battery pack. It also provides the CTL pin to directly control output or connect PTC (Positive Temperature Coefficient) resistor to monitor overtemperature of battery pack.

The TPB7462 integrates a LDO for powering external circuit with extremely low leakage current.

TPB7462 is available in WDFN2x2-8 package. Its operation temperature range is from -40°C to +85°C.

### **Detailed Description**

#### Overview

The TPB7462 series is a secondary overcharge hardware protector for 2s, 3s, or 4s lithium-ion battery packs. It provides high accuracy overcharge threshold to avoid the safety risk from battery pack. It also provides the CTL pin to directly control output or connect PTC (Positive Temperature Coefficient) resistor to monitor overtemperature of battery pack.

The TPB7462 integrates a LDO for powering external circuit with extremely low leakage current.

#### **Feature Description**

#### **Overcharge Detection**

The TPB7462 monitors VC1 to VC2, VC2 to VC3, VC3 to VC4, and VC4 to VSS voltage for over voltage protection. When the voltage of any cell exceeds VoT during charging and lasts for equal to or longer than overcharge delay time (tov), COUT pin turns to H. This is called overcharge protection mode. COUT pin drives the connecting FET to provide charge control and a second protection.

Once all the cell voltages are lower than  $V_{OT}$  +  $V_{HYS}$  and last for overcharge release time ( $t_{OVR}$ ), the overcharge is released, COUT pin turns to L, the TPB7462 enters normal state.

#### **Overcharge Timer Reset**

When an overcharge release noise that forces all the cell voltages temporarily below the overcharge detection voltage ( $V_{OT}$ ) during the overcharge delay time ( $t_{OV}$ ) counting period, the overcharge delay time will be continuously counted if the period of overcharge release noise is shorter than the overcharge delay timer reset time ( $t_{TR}$ ). Otherwise, counting of  $t_{OV}$  will be reset if the period of overcharge release noise is equal to or longer than  $t_{TR}$ . After that, when  $V_{OT}$  has been exceeded, counting  $t_{OV}$  resumes. Disabling of overcharge timer reset function is user selectable.

#### **Shutdown Detection**

The TPB7462 monitors VC1 to VC2, VC2 to VC3, VC3 to VC4, and VC4 to VSS voltage for shutdown protection. When all the cell voltages are less than the  $V_{SD}$  during discharging and last for equal to or longer than shutdown delay time ( $t_{SD}$ ), VOUT pin turns to L. Once the voltage of any cell exceeds  $V_{SDR}$ , TPB7462 enters normal mode and VOUT pin becomes to H.

#### **CTL Function**

The TPB7462 has a CTL pin to control the output of the COUT.

Table 1. Control via CTL Pin

CTL pin	COUT				
	Active High	Active Low			
"H"	Normal state	Normal state			
"Open"	"H"	"L"			
"L"	"H"	"L"			
"L" to "H"					
"H" to "L"					

www.3peak.com 10 / 16 Rev.A.1

COUT output active high/low is user selectable. Enabling/ disabling of CTL control function in the shutdown state is user selectable.

#### **Timing**

Overcharge detection

### **Application and Implementation**

#### NOTE

Information in the following applications sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

#### **Application Information**

The TPB7462 series monitors the overcharge voltage of battery for 2s, 3s, or 4s lithium-ion battery packs and controls the charging path through COUT when overcharge is detected. It also provides the CTL pin to directly control output or connect PTC resistor to monitor temperature of battery packs. The TPB7462 returns to normal state when abnormal events are disappeared.

#### **Typical Application**

Figure 7 shows the typical application schematic of the TPB7462.

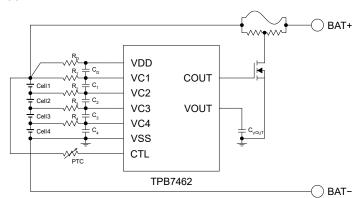

Figure 7 TPB7462 Typical Application Circuit

CVOUT Regulator output capacitor		0.1	μF	

### Layout

#### **Layout Guideline**

Both filter capacitors and output capacitor must be placed to the device pins as close as possible.

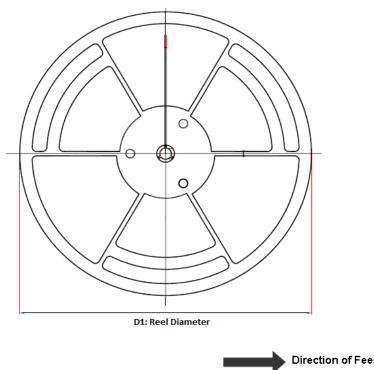

It is recommended to use wide trace lengths or thick copper weight to minimize I×R drop and heat dissipation.

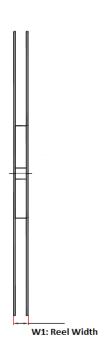

Exposed pad must be connected to the PCB ground plane directly, the copper area must be as large as possible. To get the best thermal performance, thermal vis should be placed under and around the exposed pad with enough number and size.
