

Features

- 1-FHDTV Video Filter Support FHD CVI-1080p60
- 1-HDTV Video Filter Support HD CVI-1080p30/720p60
- Optimized 6th-order Butterworth Video reconstruction filter:
 - FHD Channel: $-3 \text{ dB} \geq 72 \text{ MHz}$
 - HD Channel: $-3 \text{ dB} \geq 36 \text{ MHz}$
- Support Multiple Input Biasing:
 - Provide 80-mV Level-Shift when DC-Coupled
- Transparent Input Clamping when AC-Coupled
- Support External DC Biasing when AC-Coupled
- Very Low Quiescent Current: 6/11.5 mA (at 3.3 V, HD/FHD typ.)
- 6 dB Gain (2 V/V), Rail to Rail Output
- AC- or DC-Coupled Output Driving Dual Video Loads (75 Ω)
- Wide Power Supply: +3.0 V to +5.5 V Single Supply
- Robust ESD Protection: Robust 8 kV – HBM and 2 kV – CDM ESD Rating
- Green Product, SOT23-6 Package

Applications

- Video Signal Amplification
- Set-Top Box Video Driver
- PVR, DVD Player Video Buffer
- Video Buffer for Portable or USB-Powered Video Devices
- HDTV

Description

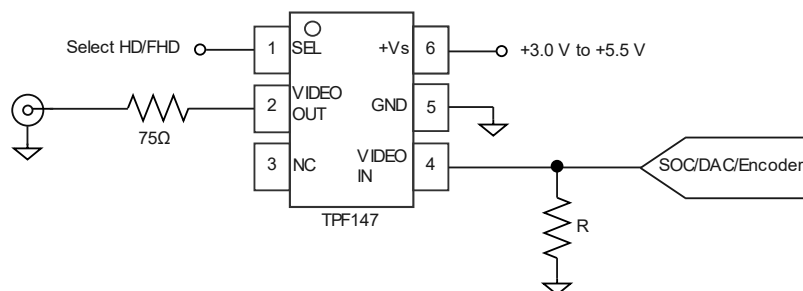

The TPF147 is specially designed for consumer applications, high-performance, low-cost video reconstruction filter, it combines excellent video performance and low power consumption perfectly. It incorporates one selectable full high-definition (FHD) and one high-definition (HD) filter channel. All filters feature sixth-order Butterworth characteristics that are useful as digital-to-analog converter (DAC) reconstruction filters or as analog-to-digital converter (ADC) anti-aliasing filters. The FHD filters can be bypassed to support 1080p60 video, and the HD filters can be bypassed to support 720p60 or 1080i60 video.

As part of the TP147 flexibility, the input can be configured for ac- or dc-coupled inputs. The 84-mV output level shift allows a full sync dynamic range at the output with 0-V input. The ac-coupled modes include a transparent sync-tip clamp option for composite video (CVI), Y', and G'B'R' signals. AC-coupled biasing for C'/P'B/P'R channels can be easily achieved by adding an external resistor to VS+.

The TP147 rail-to-rail output stage with 6-dB gain allows for both ac and dc line driving. The ability to drive two lines, or 75- Ω loads, allows for the maximum flexibility as a video line driver. The 6/11.5-mA total quiescent current at 3.3 V makes it an excellent choice for power-sensitive video applications.

The TPF147 is available in a SOT23-6 package (TPF147-TR). Its operating temperature range is from -40°C to $+85^{\circ}\text{C}$.

Detailed Description

Functional Block Diagram

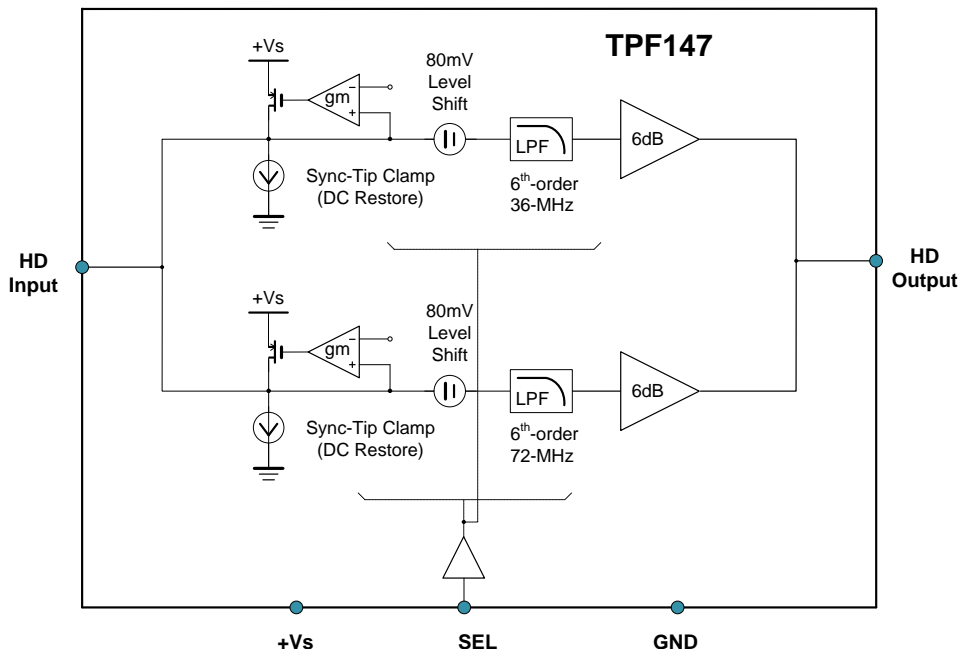

Figure 13 Functional Block Diagram

Feature Description

Internal Sync Clamp

The typical embedded video DAC operates from a ground-referenced single supply. This becomes an issue because the lower level of the sync pulse output may be at a 0 V reference level to some positive level. The problem is presenting a 0 V input to most single supply-driven amplifiers will saturate the output stage of the amplifier resulting in a clipped sync tip and degrading the video image. A larger positive reference may offset the input above its positive range.

The TPF147 features an internal sync clamp and offset function to level shift the entire video signal to the best level before it reaches the input of the amplifier stage. These features are also helpful to avoid saturation of the output stage of the amplifier by setting the signal closer to the best voltage range.

The simplified block diagram of the TPF147 is shown in Figure 13. The AC-coupled video sync signal is pulled negative by a current source at the input of the comparator amplifier. When the sync tip goes below the comparator threshold the output comparator is driven negative, The PMOS device turns on clamping sync tip to near ground level. The network triggers on the sync tip of the video signal.

Application and Implementation

NOTE

Information in the following applications sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

Application Information

The TPF147 is targeted for systems that require a selectable full high-definition (FHD) video output for CVI video support and single high-definition (HD) video outputs. Although it can be used for numerous other applications, the needs and requirements of the video signal are the most important design parameters of the TPF147. The TPF147 incorporates many features not typically found in integrated video parts while the power consumption is very low.

Typical Application

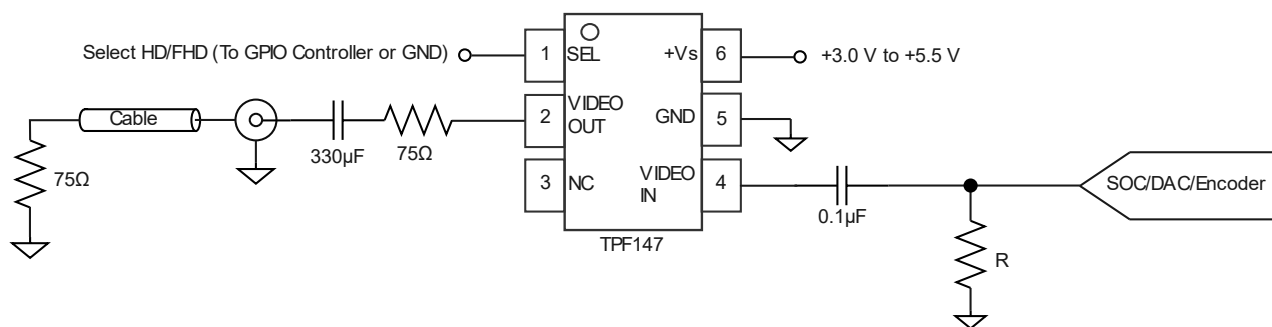

Figure 14 Typical AC-Coupled Application Circuit

Droop Voltage and DC Restoration

The selection of the input AC-coupling capacitance is based on the system requirements. A typical sync tip width of a 64 μs NTSC line is 4 μs during which the clamp circuit restores its DC level. In the remaining 60 μs period, the voltage droops because of a small constant 2.0 μA sinking current. If the AC-coupling capacitance is 0.1 μF , the maximum droop voltage is about 1 mV which is restored by the clamp circuit. The maximum pull-up current of the clamp circuit is 1.7 mA. For a 4 μs sync tip width and a 0.1 μF capacitor, the maximum restoration voltage is about 80 mV.

The line droop voltage will increase if a smaller AC-coupling capacitance is used. For the same reason, if a larger capacitance is used the line droop voltage will decrease.

Low Pass Filter--Sallen Key

The Sallen Key is a classic low-pass configuration. This provides a very stable low-pass function, and in the case of the TPF147, two six-pole roll-offs are at around 36 MHz and 72 MHz. The six-pole function is accomplished with an RC low pass network placed in series with and before the Sallen Key.

Output Couple

The TPF147 output could support both "AC Couple" and "DC Couple", if "AC Couple" is used, this capacitor's value is typically between 220- μF and 1000- μF , although 470- μF is common. The value of this capacitor must

be so large that it can minimize the line tilt (droop) and/or field tilt associated with ac-coupling as described previously.

The TPF147's internal sync clamp makes it possible to DC couple the output to a video load, eliminating the need for any AC coupling capacitors, thereby saving board space and additional expense for capacitors. This makes the TPF147 extremely attractive for portable video applications. Additionally, this solution completely eliminates the issue of field tilt in the lower frequency. The trade-off is a greater demand of supply current. The typical load current for AC coupled is around 1 mA, compared to typical 6.6 mA used when DC coupling.

Output Drive Capability and Power Dissipation

With the high output drive capability of the TPF147, it is possible to exceed the +125°C absolute maximum junction temperature under certain load current conditions. Therefore, it is important to calculate the maximum junction temperature for an application to determine if load conditions or package types need to be modified to assure the operation of the amplifier in a safe operating area. The maximum power dissipation allowed in a package is determined according to the Equation:

$$PD_{MAX} = \frac{T_{JMAX} - T_{AMAX}}{\theta_{JA}}$$

Where:

T_{JMAX} = Maximum junction temperature

T_{AMAX} = Maximum ambient temperature

θ_{JA} = Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power in the IC due to the load, or for sourcing:

$$PD_{MAX} = V_s \times I_{SMAX} + (V_s - V_{OUT}) \times \frac{V_{OUT}}{R_L}$$

Where:

V_s = Supply voltage

I_{SMAX} = Maximum quiescent supply current

V_{OUT} = Maximum output voltage of the application

R_{LOAD} = Load resistance tied to ground

By setting the two PD_{MAX} equations equal to each other, we can solve the output current and R_{LOAD} to avoid the device overheated.

Power Supply Bypassing Printed Circuit Board Layout

As with any modern operational amplifier, a well-printed circuit board layout is necessary for an optimum performance. Lead lengths should be as short as possible. The power supply pin must be well bypassed to reduce the risk of oscillation. For normal single supply operation, a single 4.7 μ F tantalum capacitor in parallel with a 0.1 μ F ceramic capacitor from + V_s to GND will suffice.
