

Low-Input, Low-Dropout, 3-A Linear Regulator with Enable Control

Features

- Input Voltage Range: 1.4 V to 6.5 V
- Adjustable Output Voltage: 0.5 V to 5.2 V
- $\pm 2\%$ Accuracy over Line Regulation, Load Regulation, and Operating Temperature Range
- 3-A Maximum Output Current
- Low Dropout Voltage: 300-mV Maximum at 3 A
- Output Enable Control
- Inherent Output Soft Start Control
- Excellent Transient Response
- High PSRR:
 - 63 dB at 1 kHz
 - 35 dB at 100 kHz
- 24- μV_{RMS} Output Voltage Noise (100 Hz to 100 kHz)
- Stable with a 10- μF Ceramic Output Capacitor
- Protection:
 - Over-Current Protection
 - Over-Temperature Protection
 - Output Short-to-Ground Protection
- Package:
 - ESOP8
- RoHS Compliant

Applications

- Communication Infrastructure
- Telecom and Networking Cards
- Motherboards and Peripheral Cards
- Computing Systems

Description

The TPL6305 is a 3-A high-current, 1.4-V low-input voltage linear regulator with only 300-mV maximum ultra-low-dropout voltage at full-load condition. The TPL6305 supports adjustable output voltage ranging from 0.5 V to 5.2 V with an external resistor divider.

Low-input voltage and ultra-low-dropout voltage make the TPL6305 the ideal power supply for applications requiring output voltage very close to the input voltage.

The TPL6305 integrates an enable control function and provides a very low standby power dissipation. The TPL6305 also provides output soft-start control and excellent transient response.

The TPL6305 provides a thermal-enhanced 8-pin ESOP package with guaranteed operating temperature ranging from -40°C to $+125^{\circ}\text{C}$.

Pin Configuration and Functions

Table 1. Pin Functions: TPL6305

Pin No.	Pin Name	I/O	Description
2	EN	I	Regulator enable pin. Drive EN high to turn on the regulator; drive EN low to turn off the regulator. The EN pin must not be left floating.
7	FB	I	Output voltage feedback pin. Connect to an external resistor divider to adjust the output voltage. Although it is not required for stability, a 10-nF feed-forward capacitor from FB to OUT (as close as possible to FB pin) is recommended to improve regulator transient performance.
8	GND	-	Ground reference pin. Connect the GND pin to the PCB ground plane directly.
3	IN	I	Input voltage pin. Suggest connecting a 10- μ F or larger ceramic capacitor from IN to ground (as close as possible to the IN pin) to reduce the jitter from the previous-stage power supply.
1, 4, 5	NC	-	Not connected internally.
6	OUT	O	Regulated output voltage pin. A 10- μ F or greater ceramic capacitor from OUT to ground (as close as possible to OUT pin) is required to ensure regulator stability.
-	Exposed Pad	-	Exposed PAD must be connected to a large-area ground plane to maximize the thermal performance.

Low-Input, Low-Dropout, 3-A Linear Regulator with Enable Control
Specifications
Absolute Maximum Ratings ⁽¹⁾

Parameter		Min	Max	Unit
IN, EN		-0.3	7	V
OUT, FB		-0.3	$V_{IN} + 0.3$	V
T _J	Junction Temperature Range	-40	150	°C
T _{STG}	Storage Temperature Range	-65	150	°C
T _L	Lead Temperature (Soldering 10 sec)		260	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

(2) All voltage values are with respect to GND.

ESD, Electrostatic Discharge Protection

Parameter		Condition	Minimum Level	Unit
HBM	Human Body Model ESD	ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4	kV
CDM	Charged Device Model ESD	ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1.5	kV

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

		$V_{IN} = 5.5\text{ V}$, $V_{OUT} = 5.2\text{ V}$, $I_{OUT} = 2\text{ A}$, $f = 100\text{ kHz}$		35	
V_N	Output Noise Voltage	$V_{IN} = 1.4\text{ V}$, $V_{OUT} = 0.5\text{ V}$, $I_{OUT} = 2\text{ A}$, $BW = 100\text{ Hz}$ to 100 kHz		24	μV_{RMS}

Low-Input, Low-Dropout, 3-A Linear Regulator with Enable Control

Parameter		Conditions	Min	Typ	Max	Unit
Temperature Range						
T _{SD}	Thermal Shutdown Threshold	Temperature increasing		160		°C
	Hysteresis			20		°C

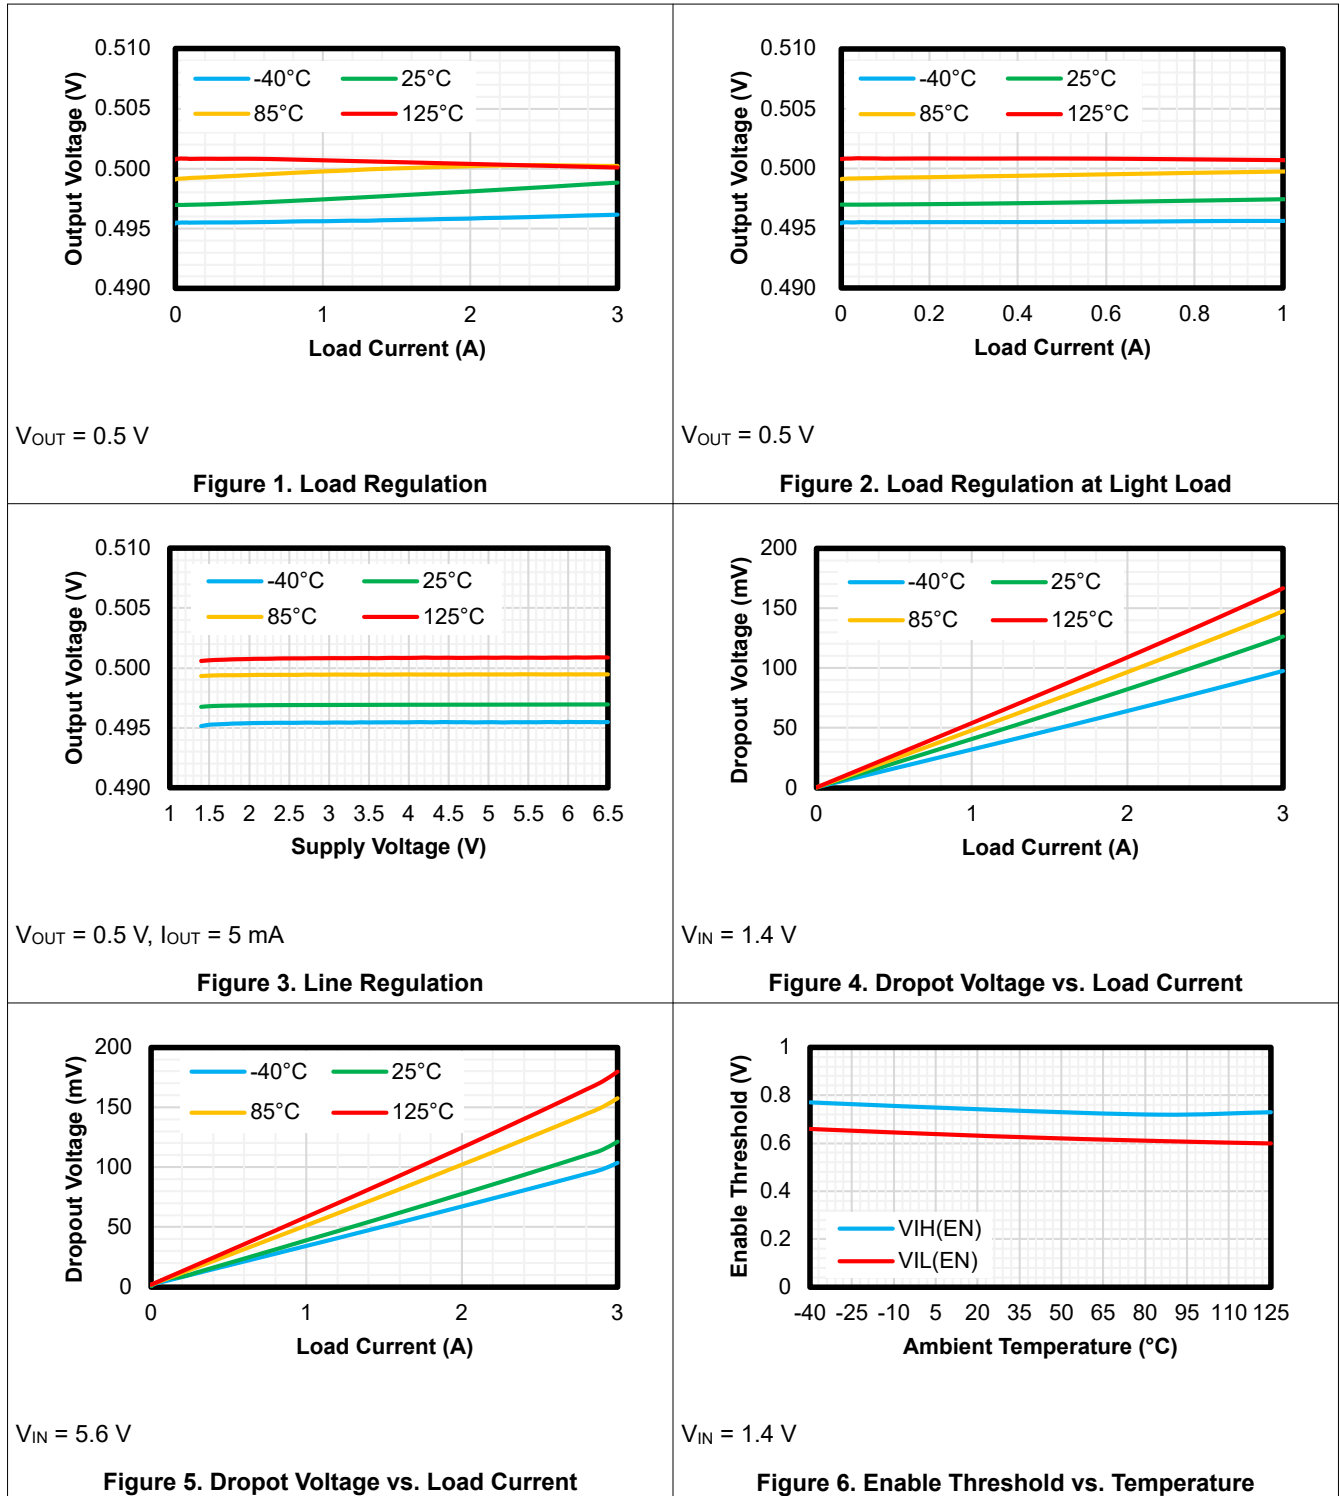

(1) $V_{IN(MIN)} = V_{OUT(NOM)} + V_{DO}$ or 1.4 V, whichever is greater.

(2) Resistor tolerance is not included. Output accuracy is not tested at this condition: $V_{OUT} = 0.5\text{ V}$, $2.3\text{ V} \leq V_{IN} \leq 6.5\text{ V}$, and $500\text{ mA} \leq I_{OUT} \leq 3\text{ A}$, because the power dissipation is out of package limitation.

(3) Dropout voltage is the minimum input to output voltage differential needed to maintain regulation at a specified output current and measure for $V_{OUT(NOM)} \geq 1.4\text{ V}$. In the dropout mode, the output voltage V_{OUT} will be equal to $V_{IN} - V_{DO}$.

Typical Performance Characteristics

All test conditions: $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ (typical value at $T_J = +25^{\circ}\text{C}$), $V_{IN} = V_{OUT(NOM)} + 0.4\text{ V}$ or 1.4 V , whichever is greater; $V_{EN} = 1.1\text{ V}$, $V_{OUT(NOM)} = 0.5\text{ V}$, $I_{OUT} = 1\text{ mA}$, $C_{IN} = 10\text{ }\mu\text{F}$, $C_{OUT} = 10\text{ }\mu\text{F}$, $C_{FF} = \text{open}$, unless otherwise noted.

Detailed Description

Overview

The TPL6305 is a 3-A high-current, 1.4-V low-input voltage linear regulator with only 300-mV maximum ultra-low-dropout voltage at full-load condition. The TPL6305 supports adjustable output voltage ranging from 0.5 V to 5.2 V with an external resistor divider.

Low-input voltage and ultra-low-dropout voltage make the TPL6305 the ideal power supply for applications requiring output voltage very close to the input voltage.

The TPL6305 integrates an enable control function and provides a very low standby power dissipation. The TPL6305 also provides output soft-start control and excellent transient response.

Functional Block Diagram

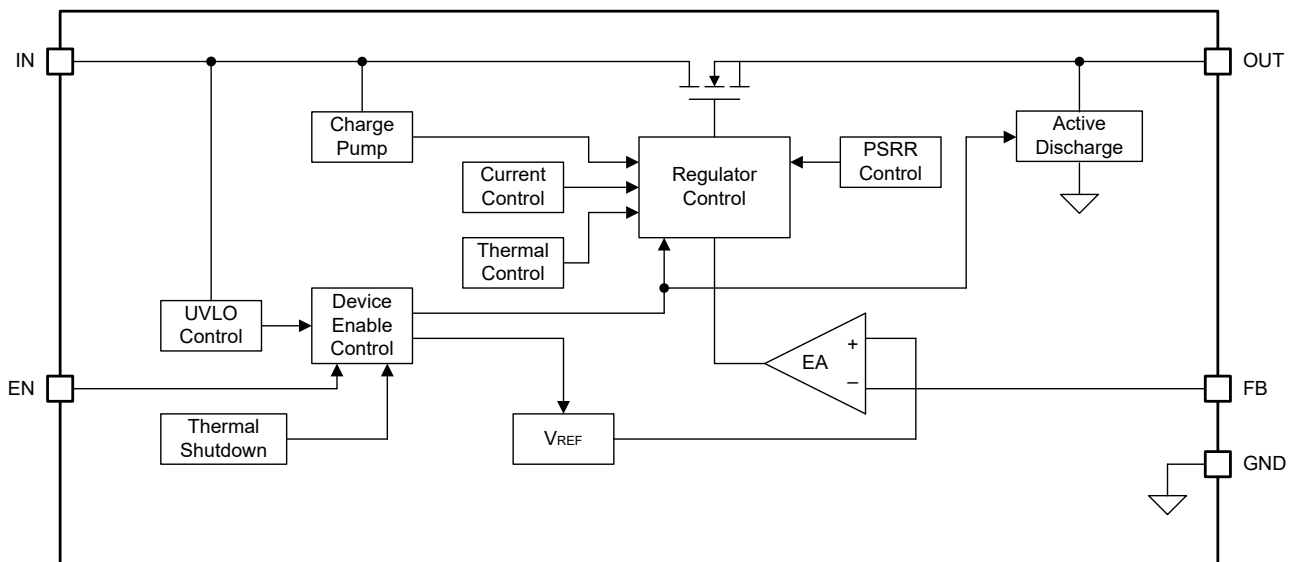

Figure 13. Functional Block Diagram

Feature Description

Enable (EN)

The TPL6305 provides a device enable pin (EN) to enable or disable the device. Connect this pin to the GPIO of an external digital logic control circuit to control the device. When the V_{EN} voltage falls below $V_{IL(EN)}$, the LDO device turns off, and when the V_{EN} ramps above $V_{IH(EN)}$, the LDO device turns on.

Under-Voltage Lockout (UVLO)

The TPL6305 uses an under-voltage lockout circuit to keep the output shut off until the internal circuitry operates properly. Refer to the [Electrical Characteristics](#) table for the UVLO threshold and hysteresis.

Adjustable Output Voltage (OUT and FB)

The TPL6305 is available in adjustable output voltage from 0.5 V to 5.2 V. The output voltage is determined by the value of the external resistor R1 and R2 in Figure 15. Use [Equation 1](#) to calculate the output voltage.

Low-Input, Low-Dropout, 3-A Linear Regulator with Enable Control

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R2}\right) \quad (1)$$

Where, the feedback voltage V_{FB} is 0.5 V.

Table 1 provides a list of recommended resistor combinations to achieve the common output voltage values.

Table 2. External Resistor Combinations

Target Output Voltage (V)	External Resistors Divider		Calculated Output Voltage (V)
	R1 (kΩ)	R2 (kΩ)	
0.50	0	Open	0.500
0.60	12.4	62	0.600
0.70	12.4	30.9	0.701
0.80	12	20	0.800
0.90	12	15	0.900
1.00	12.4	12.4	1.000
1.20	12.4	8.87	1.199
1.50	12.4	6.2	1.500
1.80	12.4	4.75	1.805
2.50	12	3	2.500
2.80	12	2.61	2.799
3.00	12	2.4	3.000
3.30	12.4	2.21	3.305
3.60	12.4	2	3.600
4.20	12	1.62	4.204
4.50	12	1.5	4.500
5.00	12	1.33	5.011

Over-Current Protection

The TPL6305 integrates an internal current limit that helps to protect the regulator during fault conditions.

- When the output voltage is pulled down below the regulated voltage, over-current protection starts to work and limit the output current to I_{LIM} .
- When the output voltage is pulled down below the short-to-ground threshold (about 140 mV), or shorted to ground directly, short-to-ground protection starts to work and limit the output current to I_{SC} .
- During startup, the output current is limited to I_{SC} before the output voltage ramps higher than the short-to-ground threshold.

Under the over-current conditions, the internal junction temperature ramps up quickly. When the junction temperature is high enough, it will cause the over-temperature protection.

Over-Temperature Protection

The over-temperature protection starts to work when the junction temperature exceeds the thermal shutdown (TSD) threshold, which turns off the regulator immediately. Until when the device cools down and the junction temperature falls below the value which equals to thermal shutdown threshold minus thermal shutdown hysteresis, the regulator turns on again.

Low-Input, Low-Dropout, 3-A Linear Regulator with Enable Control

The junction temperature range should be limited according to the [Recommended Operating Conditions](#) table, continuously operating above the junction temperature range will reduce the device lifetime.

Application and Implementation

Note

Information in the following application sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

Application Information

The TPL6305 is a 3-A high-current, 1.4-V low-input voltage linear regulator with only 300-mV maximum ultra-low-dropout voltage at full-load condition. The following application schematic shows a typical usage of TPL6305.

Typical Application

Figure 14 shows the typical application schematic of the TPL6305.

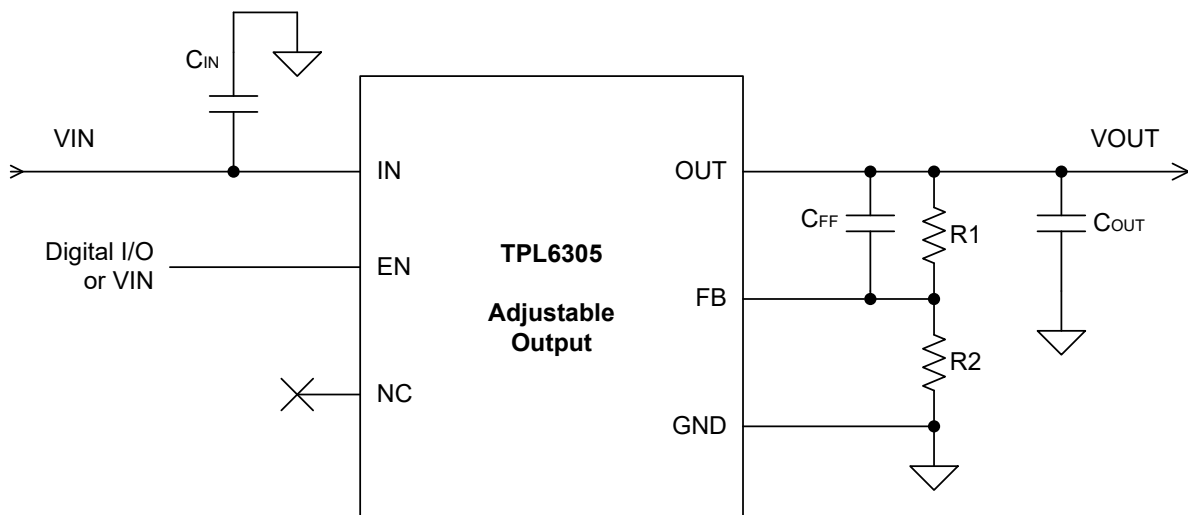

Figure 14. Typical Application Circuit

Input Capacitor and Output Capacitor

The TPL6305 is designed to be stable with low equivalent series resistance (ESR) ceramic capacitors at the input, output, and noise-reduction pin (NR/SS). It is recommended to use ceramic capacitors with X7R-, X5R-, and COG-rated dielectric materials to get good capacitive stability across temperature.

3PEAK recommends adding a 10- μ F or greater capacitor with a 0.1- μ F bypass capacitor in parallel at the IN pin to keep the input voltage stable. The voltage rating of the capacitors must be greater than the maximum input voltage.

To ensure loop stability, the TPL6305 requires a minimum value of 10- μ F low ESR output capacitor. 3PEAK recommends selecting an X7R-type 10- μ F ceramic capacitor with low ESR over temperature.

Both input capacitors and output capacitors must be placed as close to the device pins as possible.

Power Dissipation

During normal operation, LDO junction temperature should meet the requirement in the [Recommended Operating Conditions](#) table. Using below two equations to calculate the power dissipation and estimate the junction temperature.

Low-Input, Low-Dropout, 3-A Linear Regulator with Enable Control

The power dissipation can be calculated using [Equation 2](#).

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_{GND} \quad (2)$$

The junction temperature can be estimated using [Equation 3](#). θ_{JA} is the junction-to-ambient thermal resistance.

$$T_J = T_A + P_D \times \theta_{JA} \quad (3)$$

Layout

Layout Guideline

- Both input capacitors and output capacitors must be placed to the device pins as close as possible, and the vias between capacitors and device power pins must be avoided.
- It is recommended to bypass the input pin to ground with a 0.1- μ F bypass capacitor. The loop area formed by the bypass capacitor connection, the IN pin and the GND pin of the system must be as small as possible.
- It is recommended to use wide and thick copper to minimize I \times R drop and heat dissipation.
- Exposed pad must be connected to the PCB ground plane directly, the copper area must be as large as possible.
