

Automotive Low-Power Fault Protected High-Speed CAN FD Transceiver with Sleep Mode

Features

- Meet the ISO 11898-2:2016 and SAE J2284-1 to SAE J2284-5 Physical Layer Standards
- Supports CAN FD and Data Rating up to 5 Mbps
- Short Propagation Delay Times and Fast Loop Times
- 5-V Power Supply, I/O Voltage Range Supports 2.8-V to 5.5-V MCU Interface
- Standby Mode and Extra Low Current Sleep Mode with Local and Remote Bus Wake-Up Capability and INH Output
- Ideal Passive Behavior to CAN Bus when Unpowered
- Common-Mode Input Voltage: ± 30 V
- Protection Feature:
 - IEC 61000-4-2 ESD Protection up to ± 12 kV
 - Bus Fault Protection: ± 70 V
 - VCC Undervoltage Protection
 - TXD Dominant Time-Out Function and Bus-Dominant Time-Out Function
 - Thermal Shutdown Protection
- Available in SOP14 Package and Leadless DFN4.5X3-14L Package
- AEC-Q100 Qualified for Automotive Application, Grade 1

Applications

- All Devices Supporting Highly Loaded CAN Networks
- Automotive and Transportation
 - Body Electronics / Lighting
 - Power Train / Chassis
 - Infotainment / Cluster
 - ADAS / Safety

Description

The TPT1043EQ is a CAN transceiver that meets the ISO11898 high-speed CAN (Controller Area Network) physical layer standard. The device is designed to be used in CAN FD networks up to 5 Mbps, with enhanced timing margin and higher data rates in long and highly loaded networks. As designed, the device features a -30 -V to $+30$ -V common-mode range, CAN-Bus fault protection from -70 V to $+70$ V, over-voltage protection, and over-temperature shutdown. TPT1043EQ has an I/O power supply for interface I/O to connect to microcontrollers with supply voltages from 2.8 V to 5.5 V. The device comes with a standby mode, which can be waked up from the CAN BUS. The ultra-low power management controls the Electronic Control Unit (ECU) in standby and sleep modes. The device enables the power supply by the INH interface through the local and remote wake-up with wake-up source recognition, and it includes many protection features to enhance the device and network robustness.

The TPT1043EQ is available in SOP14 and DFN4.5X3-14L packages, and is characterized from -40°C to $+125^{\circ}\text{C}$.

Automotive Low-Power Fault Protected High-Speed CAN FD Transceiver with Sleep Mode

Pin Configuration and Functions

Table 1. Pin Functions: TPT1043E

Pin		I/O	Description
No.	Name		
1	TXD	Input	CAN transmit data input (low for dominant and high for recessive bus states)
2	GND	GND	Ground connection
3	VCC	Power	5-V CAN bus supply voltage
4	RXD	Output	CAN receive data output (low for dominant and high for recessive bus states), tri-state
5	VIO	Power	I/O supply voltage
6	EN	Input	Enable input for mode control, integrated pull down
7	INH	Output	Can be used to control system voltage regulators
8	ERR_N	Output	Fault output, inverted logic
9	WAKE	Input	Wake input terminal, high voltage input
10	VBAT	Power	Reverse-blocked battery supply input
11	NC	-	No connect (not internally connected)
12	CANL	Bus I/O	Low-level CAN bus input/output line
13	CANH	Bus I/O	High-level CAN bus input/output line
14	STB_N	Input	Standby input for mode control, integrated pull down
	Exposed pad	GND	Thermal pad of DFN package, required to connect the exposed pad to Ground

**Automotive Low-Power Fault Protected High-Speed CAN FD
Transceiver with Sleep Mode****Specifications****Absolute Maximum Ratings**

Parameter		Min	Max	Unit
V _{BAT}	Battery Supply Voltage Range	-0.3	60	V
V _{CC}	5-V Bus Supply Voltage Range	-0.3	7	V
V _{IO}	I/O Level-Shifting Voltage Range	-0.3	7	V
V _{BUS}	CAN Bus I/O Voltage Range (CANH, CANL)	-70	70	V
V _{BUS_DIFF}	Differential Voltage of CAN Bus, CANH - CANL	-70	70	V
V _{LOGIC}	Logic Input and Output Terminal Voltage Range (TXD, RXD, STB_N, ERR_N, EN)	-0.3	7	V
V _{WAKE}	WAKE Input Pin Voltage Range	-0.3	60 and V _{WAKE} ≤ V _{BAT} + 0.3 V	V
V _{INH}	INH Output Pin Voltage Range	-0.3	60 and V _{INH} ≤ V _{BAT} + 0.3 V	V
I _{O_LOGIC}	RXD and ERR_N Output Current	-8	8	mA
I _{O_INH_}	INH Output Current	-4	4	mA
T _J	Maximum Junction Temperature	-40	150	°C
T _{STG}	Storage Temperature Range	-65	150	°C
T _{OTP}	Shutdown Junction Temperature	-	170	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

(2) This data was taken with the JEDEC low effective thermal conductivity test board.

(3) This data was taken with the JEDEC standard multilayer test boards.

Automotive Low-Power Fault Protected High-Speed CAN FD Transceiver with Sleep Mode

ESD (Electrostatic Discharge Protection)

Parameter		Condition	Minimum Level	Unit
IEC	IEC Contact Discharge	IEC-61000-4-2, Bus Pin	±12	kV
	IEC Air-Gap Discharge	IEC-61000-4-2, Bus Pin	±15	kV
HBM	Human Body Model ESD	ANSI/ESDA/JEDEC JS-001, All Pin	±8	kV
CDM	Charged Device Model ESD	ANSI/ESDA/JEDEC JS-002, All Pin	±1.5	kV
LU	Latch Up	LU, per JESD78, All Pin, 25°C	±500	mA
		LU, per JESD78, All Pin, 125°C	±100	mA
V _{TRAN}	ISO7637-2 transients per IEC 62228-3, CANH, CANL, WAKE, VBAT	Pulse 1	-100	V
		Pulse 2a	75	V
		Pulse 3a	-150	V
		Pulse 3b	100	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Recommended Operating Conditions

Description		Min	Max	Unit

Detailed Description

Overview

The TPT1043EQ is a CAN transceiver that meets the ISO11898 High-Speed CAN (Controller Area Network) physical layer standard. The device is designed to be used in CAN FD networks up to 5 Mbps, with enhanced timing margin and higher data rates in long and highly loaded networks. As designed, the device features a -30V to $+30\text{V}$ common-mode range, CAN-Bus fault protection ranges from -70V to $+70\text{V}$, with over-voltage protection and over-temperature shutdown. TPT1043EQ has an I/O power supply for interface I/O to connect to microcontrollers with supply voltages ranging from 2.8V to 5.5V . The device, coming with the standby mode, is also waked up from the CAN BUS. The ultra-low power management controls the Electronic Control Unit (ECU) in standby and sleep modes. The power supply is enabled by the INH interface through the local and remote waking up with wake-up source recognition. The device includes many protection features to enhance device and network robustness.

Functional Block Diagram

Figure 6. Functional Block Diagram

Feature Description

Table 2. Driver Function Table

Device Mode	Inputs	Outputs		Driven BUS State
	TXD	CANH	CANL	
Normal	L	H	L	Dominant
	H or Open	Z	Z	Bus biased to VCC/2
Silent	X	Z	Z	Bus biased to VCC/2
Standby	X	Z	Z	Bus biased to GND
Go-to-Sleep	X	Z	Z	Bus biased to GND
Sleep	X	Z	Z	Bus biased to GND

Table 3. Receiver Function Table

Device Mode	CAN Differential Inputs $V_{ID} = V_{CANH} - V_{CANL}$	BUS State	RXD Terminal
Normal or Standby	$V_{ID} \geq V_{IT+(MAX)}$	Dominant	L
	$V_{IT-(MIN)} < V_{ID} < V_{IT+(MAX)}$	Indeterminate	Indeterminate
	$V_{ID} \leq V_{IT-(MIN)}$	Recessive	H
	Open ($V_{ID} \approx 0\text{ V}$)	Open	H

Device Operating Modes

The device has 5 operating modes: normal mode, standby mode, silent mode, go-to-sleep mode, and sleep mode. Operating mode selection is made via the EN pin and the STB_N pin and wake-up events when the power supply is valid.

Automotive Low-Power Fault Protected High-Speed CAN FD Transceiver with Sleep Mode

Figure 7. Mode Transition State Diagram

Normal Mode

This is the normal operating mode of the device. In the normal mode, the CAN driver and receiver block are fully operational. The transceiver will transmit and receive data via the bus lines CANH and CANL. The driver translates the digital input data on the TXD pin to differential analog output on the CAN bus. The receiver translates the differential analog data on the CAN bus to digital data output to the RXD pin. The slopes of the CAN bus output signals are controlled by an internal circuit that optimized the Electro Magnetic Emission (EME) performance. The CAN bus pin is biased to the 1/2 VCC voltage. The INH pin is active to enable the voltage regulated controlled by the INH pin.

Silent Mode

This is the listen-only mode and receive-only mode of the device. In the silent mode, the driver is disabled, releasing the bus pins to a recessive state. All other blocks, including the receiver, continue to operate in the normal mode. The silent mode can be used to prevent a faulty CAN controller from disrupting CAN bus network communications. The CAN bus pin is biased to the 1/2 VCC voltage. The INH pin is active to enable the voltage regulated controlled by the INH pin.

Automotive Low-Power Fault Protected High-Speed CAN FD Transceiver with Sleep Mode

Standby Mode

This is the first level of the low-power mode. In the standby mode, the driver and receiver of the CAN transceiver are disabled, and the device is unable to transmit or receive data. The low-power receiver is monitoring bus activity for valid wake-up requirements. The CAN bus pin is biased to the ground. The INH pin is active to enable the voltage regulator controlled by the INH pin. The pins RXD will reflect active wake-up requests as that V_{IO} and V_{BAT} are powered.

Go-to-Sleep Mode

This is the transitional mode between any mode and sleep mode. In the go-to-sleep mode, the driver and receiver of CAN transceiver are disabled, and the device is unable to transmit or receive data. The device will transition to sleep mode and the INH pin floating if the device is in the go-to sleep mode longer than t_{d_MODE} . The device will not enter sleep mode if the wake flag is set.

Sleep Mode

This is the second level of low-power mode as well as the lowest power mode. In the sleep mode, the driver and receiver of the CAN transceiver are disabled, and the device is unable to transmit or receive data, the low-power receiver is monitoring bus activity for valid wake-up requirements. The CAN bus pin is biased to the ground. The INH pin is floating to disable the voltage regulator controlled by the INH pin for additional system-level power saving. The EN and STB_N pins can be used to change modes.

Internal Flags

The TPT1043EQ has 7 Internal flags to support system diagnosis, 5 of these flags can output via ERR_N to allow the MCU to determine the status of the device and the system.

Table 4. Internal flags via ERR_N

Internal Flag	Description	Available on ERR_N	Flag is cleared
UV _{NOM}	UV _{NOM} is the V_{CC} and V_{IO} undervoltage detection flag	No	Setting the Pwon or Wake flags, by a LOW-to-HIGH transition on STB_N or when both V_{IO} and V_{CC} have recovered.
UV _{BAT}	UV _{BAT} is the V_{BAT} undervoltage detection flag	No	V_{BAT} recovered
P _{WON}	P _{WON} is the V_{BAT} power-on flag	In silent mode	Entering normal mode
Wake	The Wake flag is set when the transceiver detects a local or remote wake-up request.	In standby mode, go-to-sleep mode, and sleep mode	Entering normal mode or by setting the UV _{NOM} flag
Wake-up source	Wake-up source recognition is provided via the wake-up source flag, which is set when the wake flag is set by a local wake-up request via the wake pin.	In normal mode	Leaving normal mode

Automotive Low-Power Fault Protected High-Speed CAN FD Transceiver with Sleep Mode

Internal Flag	Description	Available on ERR_N	Flag is cleared
Bus failure	The bus failure flag is set if the transceiver detects a bus line short-circuit condition to VBAT, V CC or, GND during four consecutive dominant-recessive cycles on pin TXD, while trying to drive the bus lines dominant.	In normal mode	Re-entering normal mode or by setting the P _{WON} flag
Local failure	The four local failure events will cause the local failure flag to be set: TXD dominant clamping, TXD-to-RXD short circuit, bus dominant clamping, and an overtemperature event.	In silent mode	Entering the normal mode or when RXD is dominant while TXD is recessive or by setting the P _{WON} flag

Remote Wake-up

A dedicated wake-up pattern (ISO11898-2:2016) wakes up the TPT1043EQ from standby mode or sleep mode, this filtering prevents the device from being woken up by noise or spikes on the bus.

The wake-up pattern consists of the following:

- a dominant phase of at least $t_{wake} (busdom)$ followed by
- a recessive phase of at least $t_{wake} (busrec)$ followed by
- a dominant phase of at least $twake (busdom)$

The complete wake-up pattern must be received within $t_{to_wake_bus}$, otherwise, the wake-up logic will be reset to wait for the next valid wake-up pattern.

Device Local Faults

TXD Dominant Time-out

The device is featured with the TXD dominant time-out detection function. This function prevents a permanent low on the TXD pin, resulting in the CAN bus being driven into permanent dominant, which will cause the CAN bus network communication blocked. If the TXD remains low for longer than t_{TXD_DTO} , the transmitter will be disabled until the fault flag has been cleared.

TXD Shorted to RXD Detection

The device is featured with the function of a short circuit between TXD and RXD detection. This function prevents the CAN bus from being locked in permanent dominance, which will result in the CAN bus network communication blocked. The transmitter will be disabled until the fault flag has been cleared.

Bus Dominant Time-out

The device features the Bus dominant time-out detection function. This function prevents the CAN bus from being locked in permanent dominance, which will result in the CAN bus network communication blocked. The fault flag is set if the CAN bus remains dominant for longer than t_{BUS_DTO} and is released as soon as the bus returns to recessive.

**Automotive Low-Power Fault Protected High-Speed CAN FD
Transceiver with Sleep Mode****Under-Voltage Lockout (UVLO)**

The device integrates an under-voltage detect and lockout circuit of the supply terminal to keep the device in the protected mode if the supply voltage drops below the threshold until the supply voltage is higher than the UVLO threshold. This protects the device and system during under-voltage events on supply terminals.

Over-Temperature Protection (OTP)

The device integrates over-temperature protection circuit to prevent the device from over-heated induced damage. When the junction temperature is higher than the over-temperature protection threshold T_{OTP} , the device will shut down until the junction temperature T_J drops below the recovery threshold.

Application and Implementation

Note

Information in the following application sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

Application Information

The TPT1043EQ device is a CAN transceiver to support CAN FD function up to 5 Mbps, with BUS protection voltage from -70 V to $+70\text{ V}$, over-temperature shutdown, and a -30 V to $+30\text{ V}$ common-mode range. The VIO of TPT1043EQ can support the voltage level of TXD and RXD from 2.8 V to 5.5 V , and V_{BAT} is from battery power supply. The following sections show a typical application of the TPT1043EQ.

Typical Application

Figure 8 shows the typical application schematic of the TPT1043EQ.
