### Description

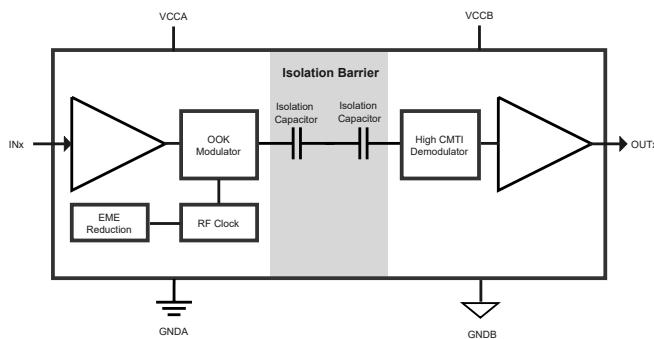

The TPT7710 devices are high-performance, dual-channel enhanced digital isolators with 5000-V<sub>RMS</sub> (WSOP8, WSOP16), and 3750-V<sub>RMS</sub> (SOP8) isolation ratings per UL 1577. These devices have also been certified by VDE, UL, CSA, TUV, CQC, and CB.

The TPT7710 devices provide high reliability and high performance at low power consumption with isolating digital input and output. Each isolation signal channel is separated by a double capacitive silicon dioxide insulation barrier. In the event of input power or signal loss, the fail-safe default output is low for devices with the suffix F and high for devices without the suffix F.

The common mode transient immunity (CMTI) and electromagnetic compatibility of the TPT7710 devices have been significantly enhanced through innovative circuit design and optimized structure.

The TPT7710 family is available in SOP8, WSOP8, and WSOP16 packages, and is characterized from  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .

### Detailed Description

#### Overview

The TPT7710 family utilize an ON-OFF Keying (OOK) modulation circuit to transmit the digital data through the isolation barrier. The transmitter sends a RF carrier to represent digital state one and sends no signal to represent the digital state zero. The devices also utilize advanced circuit design to maximise CMTI performance and minimise radiated emissions. The block diagram below shows a functional block diagram of a typical channel.

### Device Functional Modes

The table below lists the functional modes for the TPT7710 devices.

VCC <sub>I</sub>	VCC <sub>O</sub>	Input	Output	Comments
Power up	Power up	High	High	Normal Operation
		Low	Low	
		Open	Default	Default mode. The default is High for TPT7710 and Low for TPT7710F.
Power down	Power up	X	Default	Default mode: When VCC <sub>I</sub> is unpowered, the default is High for TPT7710 and Low for TPT7710F.
X	Power down	X	Undetermined	When VCC <sub>O</sub> is unpowered, a channel output is undetermined.

(1) VCC<sub>I</sub> = Input-side V<sub>CCA</sub>; VCC<sub>O</sub> = Output-side V<sub>CCB</sub>; Powered up (V<sub>CC</sub> ≥ 2.25 V); Powered down (V<sub>CC</sub> ≤ 1.7 V); X = Irrelevant

(2) The outputs are in the undetermined state when 1.7 V < VCC<sub>I</sub>, VCC<sub>O</sub> < 2.25 V.
